

Retro Fit Installation Instruction for Mark3 Model Omega Colloid Generator

The Omega Colloid Generator (OCG) can be retro fitted to most after market filtration systems comprising of ¼" water line to and from the filtration housings.

1. The (First) of the two sets of Anodes (Silver Rods) are placed between the input water line and the filter housing, by cutting the ¼" water tubing ensuring that it is close enough (1/2 meter) to the control box to plug them in (Black RCA Plug). Please make sure that tubing is cut squarely pushed into the quick fits as far as possible, to prevent leaks.
2. The (Second) of the two sets of Anodes (Silver Rods) are placed between the output side of the housing water line and the Faucet on the sink, by cutting the ¼" water tubing ensuring that it is close enough (1/2 meter) to the control box to plug them in (Black RCA Plug). Please make sure that tubing is cut squarely and pushed into the quick fits as far as possible, to prevent leaks.
3. The flow switch mechanism is placed in the same line with the second set of anodes, you must also ensure that the flow direction of the switch is pointing to the faucet tap on the sink, by cutting the ¼" water tubing ensuring that it is close enough (1/2 meter) to the control box to plug them in (Red RCA Plug). Please make sure that tubing is cut squarely and pushed into the quick fits as far as possible, to prevent leaks.
4. Once Flow switch is installed, undo the locking screw on the slider mechanism; turn the water on via the faucet, then move the slider along towards the faucet until the green light on the control box lights up (Flashes on & off) then lock into place. When the faucet is turned off the LED should stop flashing.
